BOX PATENT APPLICATION
 Assistant Commissioner for Patents
 Washington, D.C. 20231

Re: Masashi HACHINOTA
 INPUT BUFFER TYPE PACKET SWITCHING EQUIPMENT
 Our Ref. Q62534

Dear Sir:

Attached hereto is the application identified above including 15 sheets of the specification, including the claims and abstract, 4 sheets of drawings, executed Assignment and PTO 1595 form, and executed Declaration and Power of Attorney.

The Government filing fee is calculated as follows:

Total claims	6	-	20	=		x	\$18.00	=	\$0.00
Independent claims	2	-	3	=		x	\$80.00	=	\$0.00
Base Fee									\$710.00

TOTAL FILING FEE	\$710.00
Recordation of Assignment	\$40.00
TOTAL FEE	\$750.00

Checks for the statutory filing fee of \$710.00 and Assignment recordation fee of \$40.00 are attached. You are also directed and authorized to charge or credit any difference or overpayment to Deposit Account No. 19-4880. The Commissioner is hereby authorized to charge any fees under 37 C.F.R. §§ 1.16 and 1.17 and any petitions for extension of time under 37 C.F.R. § 1.136 which may be required during the entire pendency of the application to Deposit Account No. 19-4880. A duplicate copy of this transmittal letter is attached.

Priority is claimed from January 7, 2000 based on Japanese Application No. 001287/2000. The priority document is enclosed herewith.

Respectfully submitted,
 SUGHRUE, MION, ZINN,
 MACPEAK & SEAS, PLLC

INPUT BUFFER TYPE PACKET SWITCHING EQUIPMENT

BACKGROUND OF THE INVENTION

The present invention relates to input buffer type packet switching equipment in which cells inputted through input line buffers are switched and outputted to external output lines.

5 Description of the Related Art

Fig. 1 is a block diagram showing a structure of conventional input buffer type packet switching equipment. As shown in Fig. 1, the conventional input buffer type packet switching equipment consists of M input line buffers 402 corresponding to each of M input lines 401, an
10 arbiter 407, an $M \times N$ crossbar type switch 410, and N output line sections 413. In this, the M is the number of the input lines 401 and the N is the number of external output lines. And each of the M input line buffers 402 provides a distributor 403 that distributes cells inputted from each of the M input lines 401, N first in first out memories (FIFOs) 404,
15 and a selector 405 that selects cells stored in one of the N FIFOs 404. And also each of the N output line sections 413 provides a buffer 414. And the number of output lines 411 of the $M \times N$ crossbar type switch 410 is also N.

The distributor 403 supplies cells to corresponding one of the
20 FIFOs 404 based on an external output line number obtained from header information of the cells inputted from one of the M input lines 401, and makes the corresponding FIFO 404 store the cells temporarily. The selector 405 selects one of the FIFOs 404 to be read, based on a connection permission signal 412 from the arbiter 407. And the selector 405
25 outputs the cell read from one of the FIFOs 404 to the $M \times N$ crossbar type switch 410. The arbiter 407 supplies a cross point switch on/off control signal 409 to the $M \times N$ crossbar type switch 410, based on a connection request signal 406 outputted from one of the FIFOs 404 in one

of the input line buffers 402. And also the arbiter 407 supplies a connection permission signal 412 to one of the M input line buffers 402.

The $M \times N$ crossbar type switch 410 switches the cells inputted from the M input line buffers 402 through switch input lines 408. The
 5 cells switched at the $M \times N$ crossbar type switch 410 are supplied to the output line sections 413 through output lines 411.

As mentioned above, the conventional input buffer type packet switching equipment has a structure to avoid the occurrence of blocking of cells, and to increase the throughput and to decrease the discarding rate
 10 of cells at the high traffic. That is, at the conventional input buffer type packet switching equipment, the N FIFOs 404 are provided every external output line, corresponding to the number of output lines 411 of the $M \times N$ crossbar type switch 410, and the arbiter 407 decides what FIFO is used to output cells, and outputs one of the connection permission
 15 signals 412 to each of the M input line buffers 402.

However, at the conventional input buffer type packet switching equipment, when an external output line whose output line rate is slower than the corresponding input line rate exists, for example, in case that an output line # 2 (external output line) is the slower line,
 20 after switching is executed at the $M \times N$ crossbar type switch 410 to the cells for the output line # 2, the cells are stored temporarily in the buffer 414 in the output line section # 2 413, and after this the cells are read by the rate being slower than the input line rate. Therefore, even N FIFOs 404 are provided in each of the M input line buffers 402, corresponding to
 25 the N output lines 411 from the $M \times N$ crossbar type switch 410, the buffer 414 is needed in each of the output line sections 413. Consequently, there are problems that the size of the input buffer type packet switching equipment is made to be large and also the cost is increased.

SUMMARY OF THE INVENTION

It is therefore an object of the present invention to provide input buffer type packet switching equipment that can output cells to an external output line having a slower output line rate than a corresponding input line rate with reducing the size of the input buffer type packet switching equipment.

According to the present invention for achieving the object mentioned above, there is provided input buffer type packet switching equipment. The input buffer type packet switching equipment provides M input line buffers that store cells inputted from M input lines temporarily in a state that one of the M input line buffers stores cells inputted from corresponding one of the M input lines, in this the M is an integer being 2 or more, an $M \times N$ crossbar type switch, which provides N output lines, for switching cells outputted from the M input line buffers based on a cross point on/off control signal, in this N is an integer being 2 or more, N output line sections, which are provided for each of the N output lines of the $M \times N$ crossbar type switch, for outputting cells applied switching at the $M \times N$ crossbar type switch to N external output lines, and an arbiter that outputs a connection permission signal to one of the M input line buffers based on connection request signals outputted from the M input line buffers, and also outputs the cross point on/off control signal to the $M \times N$ crossbar type switch, and outputs the connection permission signal at a designated slower timing interval than a normal timing interval to one input line buffer that outputs cells to an external output line whose output line rate is slower than a corresponding input line rate.

According to the present invention, in case that cells are outputted to an external output line whose output line rate is slower than an input line rate of the corresponding input line, a timing interval outputting the cells to the $M \times N$ crossbar type switch from the input line

is made to be wider than a normal timing interval that is used at the time when the output line rate is the same that the input line rate of the corresponding input line has. The cells switched at the $M \times N$ crossbar type switch at a designated slower rate than the input line rate can be
 5 outputted to the external output line.

According to the present invention, for achieving the object mentioned above, there is provided an output line rate converting method at input buffer type packet switching equipment. The output line rate converting method, at the input buffer type packet switching equipment,
 10 which provides M input line buffers that store cells inputted from M input lines temporarily in a state that one of the M input line buffers stores cells inputted from corresponding one of the M input lines, in this the M is an integer being 2 or more, an $M \times N$ crossbar type switch, which provides N output lines, for switching cells outputted from the M input line buffers
 15 based on a cross point on/off control signal, in this N is an integer being 2 or more, N output line sections, which are provided for each of the N output lines of the $M \times N$ crossbar type switch, for outputting cells applied switching at the $M \times N$ crossbar type switch to N external output lines, and an arbiter that outputs a connection permission signal to one of
 20 the M input line buffers based on connection request signals outputted from the M input line buffers, and also outputs the cross point on/off control signal to the $M \times N$ crossbar type switch, the arbiter provides the step of; outputting the connection permission signal to one of the M input line buffers by using a designated slower timing interval than a normal
 25 timing interval in case that cells are outputted to an external output line whose output line rate is slower than a corresponding input line rate.

BRIEF DESCRIPTION OF THE DRAWINGS

The objects and features of the present invention will become
 30 more apparent from the consideration of the following detailed

description taken in conjunction with the accompanying drawings in which:

Fig. 1 is a block diagram showing a structure of conventional input buffer type packet switching equipment;

Fig. 2 is a block diagram showing a structure of an embodiment of input buffer type packet switching equipment of the present invention;

Fig. 3 is a block diagram showing a structure of an arbiter shown in Fig. 2; and

Fig. 4 is a timing interval chart of a connection permission signal outputted from a connection permission signal processing section in Fig. 3.

DESCRIPTION OF THE PREFERRED EMBODIMENT

Referring now to the drawings, an embodiment of the present invention is explained in detail. Fig. 2 is a block diagram showing a structure of the embodiment of input buffer type packet switching equipment of the present invention.

As shown in Fig. 2, the embodiment of the input buffer type packet switching equipment of the present invention provides plural M input line buffers 102-1 to 102-M that store cells inputted separately from plural M input lines 101-1 to 101-M through the connection shown in Fig. 2, an $M \times N$ crossbar type switch 110 that switches the cells, which are read from the plural M input line buffers 102-1 to 102-M and are inputted through switch input lines 108, and outputs the switched cells to N output lines 111, an arbiter 107 that supplies a cross point on/off control signal 109 to the $M \times N$ crossbar type switch 110 based on connection request signals 106-1 to 106-M outputted from selectors 105 in the input line buffers 102-1 to 102-M, and also supplies connection permission signals 112-1 to 112-M to the input line buffers 102-1 to 102-M, and output line sections 113-1 to 113-N that output the cells applied switching

at the $M \times N$ crossbar type switch 110 to the external output lines. In this, the M signifies the number of the input lines 101 and the N signifies the number of the output lines 111 and the number of the external output lines.

Each of the input line buffers 102-1 to 102- M provides N FIFOs 104-1 to 104- N , a distributor 103 that distributes inputted cells to the N FIFOs 104-1 to 104- N by corresponding to the external output line number obtained from header information of the inputted cells, and the selector 105 that selects one of the FIFOs 104-1 to 104- N to be read based on the connection permission signals 112-1 to 112- M supplied from the arbiter 107. And the connection request signals 106-1 to 106- M are outputted from the FIFOs through the selector 105 to the arbiter 107.

Fig. 3 is a block diagram showing a structure of the arbiter 107 shown in Fig. 2. As shown in Fig. 3, the arbiter 107 consists of a connection request signal processing section 201 that receives the connection request signals 106-1 to 106- M from the plural M input line buffers 102-1 to 102- M and processes the received signals, a contention controller 202 that decides from what FIFOs cells for output lines 111 are read based on the connection request signals 106-1 to 106- M received from the connection request signal processing section 201, a connection permission signal processing section 203 that outputs connection permission signals 112-1 to 112- M to each of the M input line buffers 102-1 to 102- M based on the decided result of correspondence between the input line and the external output line at the contention controller 202 and also outputs the cross point on/off control signal 109 to the $M \times N$ crossbar type switch 110.

And in case that the connection permission was given to one of the M input line buffers 102-1 to 102- M , whose corresponding external output line has a slower output line rate than the input line rate, the connection permission signal processing section 203 outputs a mask

signal 205 that notifies the contention controller 202 so that the contention controller 202 does not execute the contention control for the external output line for a designated time, and also outputs a mask cancellation signal 206 for canceling the mask to the contention controller 202.

In case that an external output line whose output line rate is slower than a corresponding input line rate exists and cells from each of the input lines 101-1 to 101-M are outputted to the external output line, when the cells are outputted by timing of a normal input line rate, the output line sections 113-1 to 113-N must read cells at the slower output line rate than the input line rate to the external output line, consequently, the cells are overflowed.

In order to avoid overflowing the cells, at the embodiment of the input buffer type packet switching equipment of the present invention, in case that the cells are outputted to the external output line whose output line rate is slower than the corresponding input line rate, output timing intervals of the connection permission signals 112-1 to 112-M to the M input line buffers 102-1 to 102-M from the arbiter 107 are adjusted to the timing to meet the slower rate than the input line rate. Therefore, the arriving interval of cells from each of the M input lines 101-1 to 101-M to the output line 111 becomes the output line rate being slower than the input line rate, consequently the cells are read at the designated rate to the external output line, and the cells are not overflowed.

Next, referring to Fig. 2, operation of the embodiment of the input buffer type packet switching equipment of the present invention is explained. When the M input line buffers 102-1 to 102-M, which store cells inputted from the M input lines 101-1 to 101-M temporarily, are notified the permission that outputs cells for an external output line whose output line rate is slower than the corresponding input line rate by connection permission signals 112-1 to 112-M from the arbiter 107, the

cells are outputted from one of the FIFOs 104 in one of the M input line buffers 102-1 to 102-M corresponding to the external output line through the $M \times N$ crossbar type switch 110 via the selector 105 and the switch input line 108.

5 After this, a different input line buffer 102 in the plural M input line buffers 102-1 to 102-M receives a connection permission signal 112 for an external output line, and cells in the FIFO 104 in the different input line buffer 102 corresponding to the external output line are outputted to the $M \times N$ crossbar type switch 110 through the selector 105
10 and the switch input line 108.

 Fig. 4 is a timing interval chart of the connection permission signal 112 outputted from the connection permission signal processing section 203 in Fig. 3. As shown in Fig. 4, in case that an external output line has a slower line output rate than a corresponding input line rate,
15 the timing interval outputting cells becomes T2 shown in Fig. 4 (b), which is “n” times wider than a normal timing interval T1 shown in Fig. 4 (a). In Fig. 4, for example, the T2 became 4 times wider than the T1.

 Next, referring to Fig. 3, a method, which makes the output timing interval of the connection permission signal wide, is explained.
20 When the contention controller 202 decides connection permission to an external output line whose output line rate is slower than an corresponding input line rate, the connection permission signal processing section 203 outputs one of connection permission signals 112-1 to 112-M to the input line buffer 102 that outputs cells to the external
25 output line, and also notifies the contention controller 202 by using a mask signal 205 so that the contention controller does not execute the contention control for the external output line at the normal timing interval for the next “n - 1” times. For example, in case that the “n” = 4, “n - 1” = 3, therefore, during the timing interval T2, the T1 does not
30 occur.

When the mask signal 205 was inputted to the contention controller 202, the contention controller 202 does not execute the contention control for the external output line. After the connection permission signal processing section 203 notified the mask signal 205 to the contention controller 202, when " $n - 1$ " times of the normal timing interval passed, the connection permission signal processing section 203 notifies the mask cancellation signal 206 to the contention controller 202. The contention controller 202 received the mask cancellation signal 206 begins the contention control for external output lines again.

In case that the contention controller 202 gives again the connection permission to an input line buffer whose corresponding external output line rate is slower than a corresponding input line rate, the connection permission signal processing section 203 outputs one of connection permission signals 112-1 to 112-M to the input line buffer 102 that outputs cells to the external output line. And also the connection permission signal processing section 203 notifies the mask signal 205 and the mask cancellation signal 206 to the contention controller 202. As a result, as shown in Fig. 4 (b), the timing interval T2 of the connection permission to each of the input lines 101 for the external output line whose output line rate is slower than the corresponding input line rate becomes wider than the normal timing interval T1. With this, the output line 111 can read cells for the external output line at the designated output line rate without any problem.

At an external output line having the same rate that a corresponding input line has, the connection permission is executed at the timing interval T1 shown in Fig. 4 (a). Therefore, the cells are outputted without any influence from processes at the time when the output line rate is slower than the input line rate.

As mentioned above, according to the present invention, in case that cells are outputted to an external output line having a slower output

line rate than the input line rate that an input line has, a timing interval outputting cells to a crossbar type switch from the input line is made to be wider than a normal timing interval at outputting the cells at the same rate that the input line has. With this, the cells are switched at the

5 crossbar type switch at a designated slower rate than the input line has, and the switched cells are outputted. Consequently, outputting sections do not need to provide a buffer for storing cells temporarily, and the output line rate can be converted with reducing the size of the input buffer type packet switching equipment.

10 While the present invention has been described with reference to the particular illustrative embodiment, it is not to be restricted by this embodiment but only by the appended claims. It is to be appreciated that those skilled in the art can change or modify the embodiment without departing from the scope and spirit of the present invention.

WHAT IS CLAIMED IS:

1. Input buffer type packet switching equipment, comprising:

M input line buffers that store cells inputted from M input lines temporarily in a state that one of said M input line buffers stores cells inputted from corresponding one of said M input lines, in this the M is an integer being 2 or more;

an $M \times N$ crossbar type switch, which provides N output lines, for switching cells outputted from said M input line buffers based on a cross point on/off control signal, in this N is an integer being 2 or more;

N output line sections, which are provided for each of said N output lines of said $M \times N$ crossbar type switch, for outputting cells applied switching at said $M \times N$ crossbar type switch to N external output lines; and

an arbiter that outputs a connection permission signal to one of said M input line buffers based on connection request signals outputted from said M input line buffers, and also outputs said cross point on/off control signal to said $M \times N$ crossbar type switch, and outputs said connection permission signal at a designated slower timing interval than a normal timing interval to one input line buffer that outputs cells to an external output line whose output line rate is slower than a corresponding input line rate.

2. Input buffer type packet switching equipment in accordance with claim 1, wherein:

said arbiter, comprising:

a connection request signal processing section that receives said connection request signals from said M input line buffers and processes said received connection request signals;

a contention controller for deciding that one of said M input line buffers requested the connection reads cells for what external output line,

based on the connection request from said M input line buffers outputted
 10 from said connection request signal processing section; and

a connection permission signal processing section that outputs
 said connection permission signal to one of said M input line buffers
 based on the contention processed result from said contention controller,
 and also outputs said cross point on/off control signal to said $M \times N$
 15 crossbar type switch, and wherein:

in case that said connection permission is given to one input
 line buffer which outputs cells to the external output line whose output
 line rate is slower than the corresponding input line rate, said connection
 permission signal processing section controls so that said contention
 20 controller does not execute the contention control for a designated
 interval corresponding to the slower output line rate than the input line
 rate.

3. Input buffer type packet switching equipment in
 accordance with claim 2, wherein:

in case that said connection permission is given to one input
 line buffer which output cells to the external output line whose output
 5 line rate is slower than the corresponding input line rate,

said connection permission signal processing section outputs a
 mask signal for stopping the contention control for a designated period to
 said contention controller and also outputs a mask cancellation signal for
 canceling the stopping of said contention control after passing said
 10 designated period to said contention controller.

4. Input buffer type packet switching equipment in
 accordance with claim 3, wherein:

said designated period is designated times of a normal timing
 interval of said connection permission signal in the case that said

- 5 connection permission is given to one input line buffer for an external output line whose output line rate is the same that the corresponding input line has.

5. Input buffer type packet switching equipment in accordance with claim 1, wherein:

each of said M input line buffers comprising:

- 5 said M \times N crossbar type switch have, for storing cells for said N external output lines temporarily and outputting said connection request signal at the time when said cells are stored;

- a distributor that distributes cells inputted from said M input lines to each of said FIFOs, corresponding to said external output line
10 obtained from header information of said cells; and

a selector that selects one FIFO to be read corresponding to said connection permission signal inputted from said arbiter from said N FIFOs.

6. An output line rate converting method at input buffer type packet switching equipment, which provides:

- M input line buffers that store cells inputted from M input lines temporarily in a state that one of said M input line buffers stores cells
5 inputted from corresponding one of said M input lines, in this the M is an integer being 2 or more;

an M \times N crossbar type switch, which provides N output lines, for switching cells outputted from said M input line buffers based on a cross point on/off control signal, in this N is an integer being 2 or more;

- 10 N output line sections, which are provided for each of said N output lines of said M \times N crossbar type switch, for outputting cells applied switching at said M \times N crossbar type switch to N external output

lines; and

- an arbiter that outputs a connection permission signal to one of
- 15 said M input line buffers based on connection request signals outputted from said M input line buffers, and also outputs said cross point on/off control signal to said $M \times N$ crossbar type switch, wherein:

said arbiter, comprising the step of:

- outputting said connection permission signal to one of said M
- 20 input line buffers by using a designated slower timing interval than a normal timing interval in case that cells are outputted to an external output line whose output line rate is slower than a corresponding input line rate.

ABSTRACT OF THE DISCLOSURE

Input buffer type packet switching equipment, which can output cells to an external output line having a slower output line rate than a corresponding input line rate without having buffers in its output line sections, is provided. The input buffer type packet switching equipment provides M input line buffers that store cells inputted from M input lines temporarily in a state that one of the M input line buffers stores cells inputted from corresponding one of the M input lines, in this the M is an integer being 2 or more, an $M \times N$ crossbar type switch, which provides N output lines, for switching cells outputted from the M input line buffers based on a cross point on/off control signal, in this N is an integer being 2 or more. The input buffer type packet switching equipment further provides N output line sections, which are provided for each of the N output lines of the $M \times N$ crossbar type switch, for outputting cells applied switching at the $M \times N$ crossbar type switch to N external output lines, and an arbiter that outputs a connection permission signal to one of the M input line buffers based on connection request signals outputted from the M input line buffers, and also outputs the cross point on/off control signal to the $M \times N$ crossbar type switch, and outputs the connection permission signal at a designated slower timing interval than a normal timing interval to one input line buffer that outputs cells to an external output line whose output line rate is slower than a corresponding input line rate. With this, the timing interval outputting the cells from one of the M input line buffers to the $M \times N$ crossbar type switch is made to be wider than the normal timing interval, therefore buffers in the output line sections are not needed.

私は、前記のとおり補正した請求の範囲を含む前記明細書の内容を検討し、理解したことを陳述する。

I hereby state that I have reviewed and understand the contents of the above-identified specification, including the claims, as amended by any amendment referred to above.

私は、連邦規則法典第37部第1章第56条(a)項に従い、本願の審査に所要の情報を開示すべき義務を有することを認める。

I acknowledge the duty to disclose information which is material to the examination of this application in accordance with Title 37, Code of Federal Regulations, §1.56(a).

Japanese Language Declaration

私は、合衆国法典第35部第119条、第172条、又は第365条に基づく下記の外国特許出願又は発明者証出願の外国優先権利益を主張し、さらに優先権の主張に係わる基礎出願の出願日前の出願日を有する外国特許出願又は発明者証出願を以下に明記する：

Prior foreign applications 先の外国出願

私は、ここに自己の知識に基づいて行った陳述がすべて真実であり、自己の所有する情報及び信ずるところに従って行った陳述が真実であると信じ、更に故意に虚偽の陳述等を行った場合、合衆国法典第18部第1001条により、罰金もしくは禁固に処せられるか、又はこれらの刑が併科され、又はかかる故意による虚偽の陳述が本願ないし本願に対して付与される特許の有効性を損なうことがあることを認識して、以上の陳述を行ったことを宣言する。

I hereby declare that all statements made herein of my own knowledge are true; and further that all statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issuing thereon.

Japanese Language Declaration

委任状： 私は、下記発明者として、以下の代理人をここに選任し、本願の手続きを遂行すること並びにこれに関する一切の行為を特許商標局に対して行うことを委任する。
(代理人氏名及び登録番号を明記のこと)

POWER OF ATTORNEY: As a named inventor, I hereby appoint the following attorney(s) and/or agent(s) to prosecute this application and transact all business in the Patent and Trademark Office connected therewith. (list name and registration number)

I hereby appoint John H. Mion, Reg. No. 18,879; Donald E. Zinn, Reg. No. 19,046; Thomas J. Macpeak, Reg. No. 19,292; Robert J. Seas, Jr., Reg. No. 21,092; Darryl Mexic, Reg. No. 23,063; Robert V. Sloan, Reg. No. 22,775; Peter D. Olexy, Reg. No. 24,513; J. Frank Osha, Reg. No. 24,625; Waddell A. Biggart, Reg. No. 24,861; Robert G. McMorro, Reg. No. 19,093; Louis Gubinsky, Reg. No. 24,835; Neil B. Siegel, Reg. No. 25,200; David J. Cushing, Reg. No. 28,703; John R. Inge, Reg. No. 26,916; Joseph J. Ruch, Jr., Reg. No. 26,577; Sheldon I. Landsman, Reg. No. 25,430; Richard C. Turner, Reg. No. 29,710; Howard L. Bernstein, Reg. No. 25,665; Alan J. Kasper, Reg. No. 25,426; Kenneth J. Burchfiel, Reg. No. 31,333; Gordon Kit, Reg. No. 30,764; Susan J. Mack, Reg. No. 30,951; Frank L. Bernstein, Reg. No. 31,484; Mark Boland, Reg. No. 32,197; William H. Mandir, Reg. No. 32,156; Scott M. Daniels, Reg. No. 32,562; Brian W. Hannon, Reg. No. 32,778; Abraham J. Rosner, Reg. No. 33,276; Bruce E. Kramer, Reg. No. 33,725; Paul F. Neils, Reg. No. 33,102; and Brett S. Sylvester, Reg. No. 32,765, my attorneys to prosecute this application and to transact all business in the Patent and Trademark Office connected therewith, and request that all correspondence about the application be addressed to SUGHRUE, MION, ZINN, MACPEAK & SEAS, PLLC, 2100 Pennsylvania Avenue, N.W., Washington, D.C. 20037-3202.
